IDEC

RF1V Force Guided Relays
SF1V Relay Sockets

New

IDEC CORPORATION

Enables flexible construction of safety circuits

Complies with International Standards

Force guided contact mechanism
(EN50205 Type A TÜV approved)

Fast Response Time

Response time of 8 ms.
Ensures safety by turning the load off quickly.
(200 m/s² minimum)

High Shock Resistance

High shock resistant suitable for use in machine tools and in environments subjected to vibration and shocks.

Clear Visiblilty

Available with a built-in LED.

Compact and Slim

Compact size enables size reduction of PC board.
4-pole type: 13W × 40D × 24H mm
6-pole type: 13W × 50D × 24H mm

Socket Variation

PC board mount and DIN rail mount sockets are available.

PC board mount   DIN rail mount

What is a force guided relay?

Relays used in safety circuits to detect failures such as contact welding and damage to the contact spring.

Contacts of a force guided relay are forced to open and close by a guide connected to the armature.
Due to requirements of standard EN50205, a force guided relay has independent NO and NC contacts. If a NO contact welds, a NC contact will not close even when the relay coil is turned off (de-energized) and must maintain a gap of at least 0.5 mm. Furthermore, if a NC contact welds, a NO contact will not close when the relay is turned on (energized) and must maintain a gap of at least 0.5 mm.
(General-purpose relays do not have the above characteristics.)

De-energized (Normal Condition) — NO contact, NC contact, Guide, Armature

Energized (Normal Condition) — NO contact, NC contact, Guide, Armature

De-energized (Abnormal Condition) — NO contact is welded, A gap of at least 0.5 mm is maintained

Energized (Abnormal Condition) — A gap of at least 0.5 mm is maintained, NC contact is welded

Guide   NC contact   NO contact

Applications

Force guided relays are used in safety circuits in combination with interlock switches, light curtains, and emergency stop switches to control outputs.
They can also be used to expand outputs for safety relay modules and safety controllers.

Output expansion for safety relay modules and safety controllers

·HR1S Safety Relay Module

Cost effective and easy method to expand mechanical contact outputs.

·Circuit Example

Interlock Switch/Emergency Stop Switch   Start Switch   F1 F2

Safety Relay Module

EDM Input

Safety Output Expansion

K2 — Force Guided Relays
K1 — Force Guided Relays

EDM input: External device monitor input

·FS1A Safety Controller

Solid state safety outputs of safety controllers can be converted to mechanical contact outputs.

·Circuit Example

Interlock Switch/Emergency Stop Switch   Start Switch

Safety Controller

EDM Input

24V

Safety Output Expansion

K2 — Force Guided Relays
K1 — Force Guided Relays

IDEC
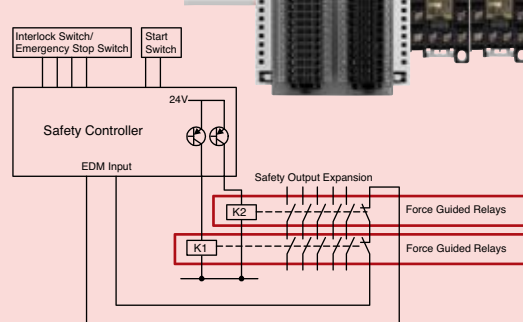

RF1V Force Guided Relays / SF1V Relay Sockets

Compact and EN compliant RF1V force guided relays.

- Force guided contact mechanism
  (EN50205 Type A TÜV approved)
- Contact configuration
  4-pole (2NO-2NC, 3NO-1NC)
  6-pole (4NO-2NC, 5NO-1NC, 3NO-3NC)
- Built-in LED indicator available.
- Fast response time (8 ms maximum).
- High shock resistance (200 m/s² minimum)
- Finger-safe DIN rail mount socket and PC board
  mount socket.

		48V DC	10.4	4608				
	3NO-3NC	12V DC	41.7	288				
		24V DC	20.8	1152				
		48V DC	10.4	4608				

Note 1: For relays with LED indicator, the rated current increases by approx. 2 mA.
Note 2: Maximum continuous applied voltage is the maximum voltage that can be applied to relay coils.

Relay Specifications

Number of Poles	4-pole		6-pole		
Contact Configuration	2NO-2NC	3NO-1NC	4NO-2NC	5NO-1NC	3NO-3NC
Contact Resistance (initial value) (Note 1)	100 mΩ maximum				
Contact Material	AgSnO$_2$ (Au flashed)				
Rated Load (resistive load)	6A 250V AC, 6A 30V DC				
Allowable Switching Power (resistive load)	1500 VA, 180W				
Allowable Switching Voltage	250V AC, 30V DC				
Allowable Switching Current	6A				
Minimum Applicable Load (Note 2)	5V DC, 1 mA (reference value)				
Power Consumption (approx.)	0.36W		0.5W		
Insulation Resistance	1000 MΩ minimum (500V DC megger, same measurement positions as the dielectric strength)				
Dielectric Strength — Between contact and coil	4000V AC, 1 minute				
Dielectric Strength — Between contacts of different poles	2500V AC, 1 minute Between contacts 7-8 and 9-10		2500V AC, 1 minute Between contacts 7-8 and 11-12 Between contacts 9-10 and 13-14 Between contacts 11-12 and 13-14		
	4000V AC, 1 min. Between contacts 3-4 and 5-6 Between contacts 3-4 and 7-8 Between contacts 5-6 and 9-10		4000V AC, 1 min. Between contacts 3-4 and 5-6 Between contacts 3-4 and 7-8 Between contacts 5-6 and 9-10 Between contacts 7-8 and 9-10		
Dielectric Strength — Between contacts of the same pole	1500V AC, 1 minute				
Operate Time (at 20°C)	20 ms maximum (at the rated coil voltage, excluding contact bounce time)				
Response Time (at 20°C) (Note 3)	8 ms maximum (at the rated coil voltage, excluding contact bounce time)				
Release Time (at 20°C)	20 ms maximum (at the rated coil voltage, excluding contact bounce time)				
Vibration Resistance — Operating Extremes	10 to 55 Hz, amplitude 0.75 mm				
Vibration Resistance — Damage Limits	10 to 55 Hz, amplitude 0.75 mm				
Shock Resistance — Operating Extremes (half sine-wave pulse: 11 ms)	200 m/s^2, when mounted on DIN rail mount socket: 150 m/s^2				
Shock Resistance — Damage Limits (half sine-wave pulse: 6 ms)	1000 m/s^2				
Electrical Life	250V AC 6A resistive load: 100,000 operations minimum (operating frequency 1200 per hour) 30V DC 6A resistive load: 100,000 operations minimum (operating frequency 1200 per hour) 250V AC 1A resistive load: 500,000 operations minimum (operating frequency 1800 per hour) 30V DC 1A resistive load: 500,000 operations minimum (operating frequency 1800 per hour) [AC 15] 240V AC 2A inductive load: 100,000 operations minimum (operating frequency 1200 per hour, cos ø = 0.3) [DC 13] 24V DC 1A inductive load: 100,000 operations minimum (operating frequency 1200 per hour, L/R = 48 ms)				
Mechanical Life	10 million operations minimum (operating frequency 10,800 operations per hour)				
Operating Temperature (Note 4)	–40 to +85°C (no freezing)				
Operating Humidity	5 to 85%RH (no condensation)				
Storage Temperature	–40 to +85°C				
Operating Frequency (rated load)	1200 operations per hour				
Weight (approx.)	20g		23g		

Note 1: Measured using 6V DC,1A voltage drop method.
Note 2: Failure rate level P (reference value)
Note 3: Response time is the time until NO contact opens, after the coil voltage is turned off.
Note 4: When using at 70 to 85°C, reduce the switching current by 0.1A/°C.

Socket Specifications

Type	SF1V-4-07L	SF1V-6-07L	SF1V-4-61	SF1V-6-61
Rated Current	6A			
Rated Voltage	250V AC/DC			
Insulation Resistance	1000 MΩ minimum (500V DC megger, between terminals)			
Dielectric Strength	2500V AC, 1 minute (between terminals)			
Screw Terminal Style	M3 slotted Phillips screw		—	
Applicable Wire	0.7 to 1.65 mm^2 (18 AWG to 14 AWG)		—	
Recommended Screw Tightening Torque	0.5 to 0.8 N·m		—	
Terminal Strength	Wire tensile strength: 50N min.		—	
Vibration Resistance	Damage limits: 10 to 55 Hz, amplitude 0.75 mm Resonance: 10 to 55 Hz, amplitude 0.75 mm			
Shock Resistance	1000 m/s^2			
Operating Temperature (Note)	–40 to +85°C (no freezing)			
Operating Humidity	5 to 85% RH (no condensation)			
Storage Humidity	–40 to +85°C			
Degree of Protection	IP20 (finger-safe screw terminals)		—	
Weight (approx.)	40g	55g	9g	10g

Note: When using at 70 to 85°C, reduce the switching current by 0.1A/°C.

Applicable Crimping Terminals

Note: Ring tongue terminals cannot be used.

Notes on Contact Gaps except Welded Contacts

Example: RF1V-2A2B-D24
- If the NO contact (7-8 or 9-10) welds, the NC contact (3-4 or 5-6) remains open even when the relay coil is de-energized, maintaining a gap of 0.5 mm. The remaining unwelded NO contact (9-10 or 7-8) is either open or closed.
- If the NC contact (3-4 or 5-6) welds, the NO contact (7-8 or 9-10) remains open even when the relay coil is energized, maintaining a gap of 0.5 mm. The remaining unwelded NC contact (5-6 or 3-4) is either open or closed.

Instructions

1. Driving Circuit for Relays

1. To make sure of correct relay operation, apply rated voltage to the relay coil. Pickup and dropout voltages may differ according to operating temperature and conditions.

2. Input voltage for DC coil:
A complete DC voltage is best for the coil power to make sure of stable operation. When using a power supply containing a ripple voltage, suppress the ripple factor within 5%. When power is supplied through a rectifications circuit, relay operating characteristics, such as pickup voltage and dropout voltage, depend on the ripple factor. Connect a smoothing capacitor for better operating characteristics as shown below.

$$\text{Ripple Factor (\%)} \quad \frac{Emax - Emin}{Emean} \times 100\%$$

Emax = Maximum of pulsating current
Emin = Minimum of pulsating current
Emean = DC mean value

3. Operating the relay in sync with an AC load:
If the relay operates in sync with AC power voltage of the load, the relay life may be reduced. If this is the case, select a relay in consideration of the required reliability for the load. Or, make the relay turn on and off irrespective of the AC power phase or near the point where the AC phase crosses zero voltage.
4. Leakage current while relay is off:
When driving an element at the same time as the relay operation, special consideration is needed for the circuit design. As shown in the incorrect circuit below, leakage current (Io) flows through the relay coil while the relay is off. Leakage current causes coil release failure or adversely affects the vibration resistance and shock resistance. Design a circuit as shown in the correct example.
5. Surge suppression for transistor driving circuits:
When the relay coil is turned off, a high-voltage pulse is generated. Be sure to connect a diode to suppress the counter electromotive force. Then, the coil release time becomes slightly longer. To shorten the coil release time, connect a Zener diode between the collector and emitter of the controlling transistor. Select a Zener diode with a Zener voltage slightly higher than the power voltage.
6. The coil terminal of the relay has polarity. Connect terminals according to the internal connection diagram. Incorrect wiring may cause malfunction.

2. Protection for Relay Contacts

1. The contact ratings show maximum values. Make sure that these values are not exceeded. When an inrush current flows through the load, the contact may become welded. If this is the case, connect a contact protection circuit, such as a current limiting resistor.

2. Contact protection circuit:
When switching an inductive load, arcing causes carbides to form on the contacts, resulting in an increased contact resistance. In consideration of contact reliability, contact life, and noise suppression, use of a surge absorbing circuit is recommended. Note that the release time of the load becomes slightly longer. Check the operation using an actual load. Incorrect use of a contact protection circuit will adversely affect switching characteristics. Four typical examples of contact protection circuits are shown in the following table:

	Circuit	Description
RC	Power — C R — Ind. Load	This protection circuit can be used when the load impedance is smaller than the RC impedance in an AC load power circuit. R: Resistor of approximately the same resistance value as the load C: 0.1 to 1 µF
RC	Power — C R — Ind. Load	This protection circuit can be used for both AC and DC load power circuits. R: Resistor of approximately the same resistance value as the load C: 0.1 to 1 µF
Diode	Power — D — Ind. Load	This protection circuit can be used for DC load power circuits. Use a diode with the following ratings. Reverse withstand voltage: Power voltage of the load circuit × 10 Forward current: More than the load current
Varistor	Power — Varistor — Ind. Load	This protection circuit can be used for both AC and DC load power circuits. For a best result, when using on a power voltage of 24 to 48V AC/DC, connect a varistor across the load. When using on a power voltage of 100 to 240V AC/DC, connect a varistor across the contacts.

3. Do not use a contact protection circuit as shown below:

| Circuit	Description
Power — C — Load	This protection circuit is very effective in arc suppression when opening the contacts. But, the capacitor is charged while the contacts are opened. When the contacts are closed, the capacitor is discharged through the contacts, increasing the possibility of contact welding.
Power — C — Load	This protection circuit is very effective in arc suppression when opening the contacts. But, when the contacts are closed, a current flows to charge the capacitor, causing contact welding.

Generally, switching a DC inductive load is more difficult than switching a DC resistive load. Using an appropriate arc suppressor will improve the switching characteristics of a DC inductive load.

3. Usage, transport, and storage conditions

1. Temperature, humidity, atmospheric pressure during usage, transport, and storage.
   ① Temperature: –45°C to +85°C (no freezing)
   When the temperature is 70 to 80°C, reduce the 6A max. switching current by 0.1 A/°C
   ② Humidity: 5 to 85%RH (no condensation)
   The humidity range varies with temperature. Use within the range indicated in the chart below.
   ③ Atmospheric pressure: 86 to 106 kPa

Operating temperature and humidity range
2. Condensation
Condensation occurs when there is a sudden change in temperature under high temperature and high humidity conditions. The relay insulation may deteriorate due to condensation.

3. Freezing
Condensation or other moisture may freeze on the relay when the temperatures is lower than 0°C. This causes problems such as sticking of movable parts or delay in operation.

4. Low temperature, low humidity environments
Plastic parts may become brittle when used in low temperature and low humidity environments.

4. Panel Mounting

When mounting DIN rail mount sockets on a panel, take the following into consideration.
- Use M3.5 screws, spring washers, and hex nuts.
- For mounting hole layout, see page 6.
- Keep the tightening torque within 0.49 to 0.68 N·m. Excessive tightening may cause damage to the socket.

5. Others

1. General notice:
   ① To maintain the initial characteristics, do not drop or shock the relay.
   ② The relay cover cannot be removed from the base during normal operation. To maintain the initial characteristics, do not remove the relay cover.
   ③ Use the relay in environments free from condensation, dust, sulfur dioxide (SO_2), and hydrogen sulfide (H_2S).
   ④ The RF1V relay cannot be washed as it is not a sealed type. Also make sure that flux does not leak to the PC board and enter the relay.

2. Connecting outputs to electronic circuits:
When the output is connected to a load which responds very quickly, such as an electronic circuit, contact bouncing causes incorrect operation of the load. Take the following measures into consideration.
   ① Connect an integration circuit.
   ② Suppress the pulse voltage due to bouncing within the noise margin of the load.

3. Do not use relays in the vicinity of strong magnetic field, as this may affect relay operation.

4. UL and CSA ratings may differ from product rated values determined by IDEC.

6. Notes on PC Board Mounting

- When mounting 2 or more relays on a PC board, keep a minimum spacing of 10 mm in each direction. If used without spacing of 10 mm, rated current and operating temperature differs. Consult IDEC.
- Manual soldering: Solder the terminals at 400°C within 3 sec.
- Auto-soldering: Preliminary heating at 120°C within 120 sec. Solder at 260°C±5°C within 6 sec.
- Because the terminal part is filled with epoxy resin, do not excessively solder or bend the terminal. Otherwise, air tightness will degrade.
- Avoid the soldering iron from touching the relay cover or the epoxy filled terminal part. Use a non-corrosive resin flux.

Control circuits conforming with safety categories 2, 3, and 4 can be constructed.

·Safety category 4 control circuits

The circuit example below consisting of interlock switches, force guided relays, and safety contactors are only a part of a safety-related system in a machine. In actual machines, risk assessment must be performed taking various aspects into consideration such as hazard types, safeguarding measures, and change of hazard level in operating mode, in order to reduce the risk of the entire machine to a tolerable level. The safety category of a machine needs to be evaluated for the entire safety-related system.

·Safety function at occurrence of single faults

1. If a short-circuit failure occurs at either of the S1 channels, when the safety guard is opened, K2 does not turn off but K1 turns off, so safety function (power interruption to the motor) is maintained. The system does not restart because the NC contact of K2 remains open and K3 is not energized even when S2 is turned on.
2. If a short-circuit failure occurs between S1 channels, the potential difference of K1 and K2 coils become 0V, turning K1 and K2 off. (Fault detection function between safety input circuits)
3. If NO contact of KM1 is welded, KM2 turns off when the safety guard is opened, so the safety function (power interruption to the motor) is maintained. The system does not restart because the NC contact remains open and K3 is not energized even when S2 is turned on.
4. If the NO contact of K1 is welded, K2 turns off when the safety guard is opened, so the safety function (power interruption to the motor) is maintained. The system does not restart because the NC contact of K1 remains open and K3 is not energized even when S2 is turned on.
5. If NC contact of K3 is welded, K1 and K2 turn off when the safety guard is opened, so the safety function (power interruption to the motor) is maintained. Also, the system does not restart because NO contact of K3 does not shut, therefore K1 and K2 cannot be energized.
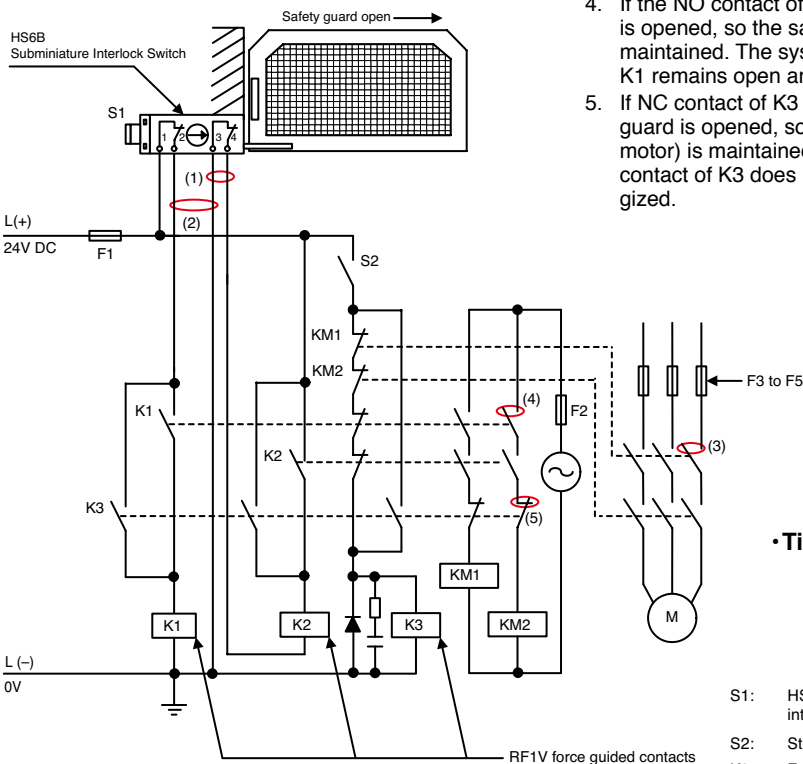

S1:	HS6B subminiature interlock switch
S2:	Start switch (HW series momentary type)
K1, K2, K3:	RF1V force guided relays
KM1, KM2:	Safety contactor
M:	Motor
F1:	Protection fuse for safety circuit
F2:	Protection fuse for mechanical contact output of force guided relay contact
F3 to F5:	Protection fuse for mechanical contact output of safety contactors
